Yet again AKVIS have produced a simple to use program that gives the quality results that you want.

AKVIS Enhancer is image enhancement software for revealing details on a picture that is underexposed, overexposed or has mid tone areas of a photo that need correcting without manipulating exposure. It brings out details by intensifying color transition. It means that Enhancer strengthens the difference between adjacent pixels having different color gradations and therefore reveals not only details in the shadow but even details in the overexposed and mid tone areas.

AKVIS Enhancer is useful not only for correction of family and art photos, but can be effective as well in technical use. Publishers of technical literature can apply Enhancer to show equipment illustrations in detail; doctors can use Enhancer to increase the level of detail on roentgenograms, etc. The program is compatible with the following digital photo software - Adobe Photoshop (v. 5 and above) and Photoshop Elements (v. 1 and above), Jasc Paint Shop Pro (v. 6 and above), ACD FotoCanvas (v. 3), Ulead PhotoImpact (v. 8).

Another "must have" if you do any image correction.
